APPENDIX A - CROSS REFERENCE TO ORIGINAL EBC DATA DICTIONARY VARIABLES	152

INTRODUCTION

In November 2016, three colleagues from the Center for Health Statistics & Informatics (CHSI) attended Quality Improvement Training sponsored by the New Jersey Department of Health (NJDOH). As a result of this training program, the Birth File Quality Improvement Project (QI Project) was formed to address some problem areas identified with the historical birth files. The main problem arose from the existence of multiple birth files with many different file layouts and versions. Other underlying issues included lack of standardization in variable names, lengths, data types, and coding schemes. In addition, there were issues with data corruption, duplicate birth records, and redundant variables.

The main objective of the QI Project was to create a single electronic birth file from years 2000 to 2015 containing all the available data in a standardized data set. The purpose was to improve the data quality of the electronic birth file through data cleaning and standardization. However, we did not intend to create a perfectly clean data set. Users may decide to perform additional data preparation to suit the requirements of their job.

Additional QI Project team members joined and over a two-year period, we made many changes. These changes include the following:

- Converted birth files from fixed position text files to SAS data sets.
- Assigned standard data set names to each birth file.
- Modified and updated birth file layout documentation.
- Deleted duplicate birth records.
- Assigned unique state file numbers to each birth record.
- Identified misaligned records and realigned values into the correct columns.
- Eliminated certain redundant variables.
- Validated data values using table lookups and sets of acceptable values.
- Modified variable formats to make them consistent across multiple years.
- Converted text to upper case.
- Removed excess spaces, embedded commas, and dashes.

The final product of these changes was a new data set called the Master Electronic Birth File (EBF). The EBF included every birth data point available through the years. As much as possible, we tried to retain the original values of the data points. For this reason, the EBF shows a true historical perspective. The EBF is available for individual years from years 2000 to 2015. There is also an EBF file containing all the years.

The Electronic Birth File Data Dictionary (EBF Data Dictionary) provides information on all the variables in the EBF. This documentation reflects the general format of the underlying data. There are four generic data types mentioned in this document: numeric, character, date and time. These data types do not refer to a data type or format belonging to any particular computer language or application. For purposes of this document, the numeric data type consists entirely of

the digits 0-9. The character data type includes any combination of the digits 0-9 and other non-numeric characters, such as, letters of the alphabet. The date data type consists of digits 0-9. The time data type consists of digits 0-9, colon delimiters and AM/PM suffixes. Regardless of the data type specified in the dictionary, the EBF values are all stored and delivered in string characters. Values are not formatted except as indicated in the dictionary.

In sum, we hope that the EBF Data Dictionary serves as a practical guide for users of the EBF. It represents the cumulative efforts of QI Project team members.

141-147. NEWBORN HEARING SCREEN

NEWBORN HEARING SCREEN (Variables 141 to 147 and 446-448)
Notes: The type and result of inpatient hearing screening exam conducted.
<p>a. <u>Hearing screen methods</u> - The otoacoustic emissions tests (OAE) consist of acoustic responses produced in the inner ear, which is measured with a low noise microphone placed in the ear canal.</p> <p>DPOAE – Distortion product otoacoustic emissions test TEOAE – Transient emissions otoacoustic emissions test</p> <p>The auditory brainstem response (ABR) consists of a series of minute electrical potentials, occurring in the auditory nervous system in response to sound. These potentials are extracted from ongoing EEG via the use of an averaging computer.</p> <p>Conventional ABR – In the conventional method, the threshold of wave V is investigated. Conventional ABR requires a trained technician or audiologist to perform the evaluation and an audiologist to interpret the screening results.</p> <p>Automated ABR - In the automated mode, the presence of wave V is usually assessed for only one intensity level. The equipment is fully automated and elicits a pass/refer response. There is no interpretation required.</p>

Some hospitals may attempt a retest if the baby does not pass the initial hearing screening. The results and date of test for the last inpatient test conducted for each ear for the child are recorded. If the baby is re-screened as an inpatient after these fields are inputted, they are updated to reflect the last test completed for each ear prior to discharge. If the first test type used is different from the second test type (i.e. – baby is screened first with OAE equipment, followed by ABR equipment), option 5 (“Both OAE and ABR”) was used for data entry purposes.

If an ear was not screened due to physical deformities (atresia, anotia, etc.), option 7 (“Test Not Done”) is entered for that ear. If so, the variable 443. DIAGNOSIS OF INFANT-STIGMATA/ANOMALIES ASSOCIATED WITH HEARING LOSS was also marked as “yes”.

- b. Hearing screen results - A pass result is indicated by a “passed” designation if using automated equipment, or documentation of a hearing threshold down to 30dB if using conventional testing. A “referred” result is indicated if automated equipment provides a “fail” or “refer” result for documentation of a hearing threshold of greater than 30dB if using conventional testing. An “inconclusive” is used only when the test was administered, and the automated equipment provides a result such as “inconclusive” or “unknown”.
- c. Hearing screen sequence - Whether it is an initial screen or rescreen for the testing that is documented. If more than one test was done on the ear, “Repeat screen” should be indicated. This applies if one test method was used more than once (i.e. baby had OAE test done 2 time on that ear), or if more than one test method was used (OAE was followed by ABR).
